Arrays

An array is a collection of elements stored in contigous memory location.

All elements of array are of same data type (int, float etc.)

Array allow for ejicient access and manipulation of data.

Disadvantage → fixed size a[10]
One type

Colly reference vs value → hetoregous (Python list)
speed a little slow
not so much

Static vs dynamic array.

In python we use list instead of array as they provide more flexibility. However, python provide ability to use array via libraries such as numpy and array

	Array	List
Data type	Homogenous (same type)	Heterogenous (different type)
Flexibity	Fixed size	Dynamic (can grow and shrink)
Performance	More memory efficient for large data.	Slower for larger dataset
Usage in Python	Use array or numpy	Built in
